

Project A Documentation

PROJECT Documentation

Important: This part consists of **two separate pieces of writing** with different purposes.

Part 1 ("for a public readers"):

This part is designed to be **very short**. Its purpose is to give the most basic information about your project, but not necessarily all there is to know - the function of this text is to **make a reader interested** to try it out for themselves. The audience of this text is a public audience, for example viewers of the work in a show setting.

1. Your Name as you want it to be associated with the work (in a public show setting).
2. The Project Title (this should be catchy, arouse interest, be short, poetic)
3. The Project Subtitle (a more descriptive subtitle)
4. Very Short Description of your Project (describe your project in two sentences)
5. Abstract. 100-150 words that touch upon the contextual meaning of your project.
The purpose is to give the viewer a loose framework within which they can read/interpret/enjoy your project.
6. Images (1-3 images, each with a short caption. These can be animated GIFs. their purpose is not to explain details of your project, but solely to look good, to arouse interest, to attract the viewer into trying your project out for themselves.)

Example (title & subtitle): "Mirroring Loss: One Year In One Minute" by Winny Wang (note: you don't need an Artist Description like in the example)

Part 2 ("for yourself (and your instructor)"):

The primary audience for this text is your future-self, your classmates and your instructor. You are asked to describe the process you went through in producing the work, as well as reflecting on the outcomes and your learning.

This reflection should at a minimum address the following:

1) Process: Design and Composition

Describe the design process of your project. Explain your decisions that lead to the visual appearance of your work, as well as the user interaction. Make sure you include iterations, things you tried but didn't work, and conclusions you drew. Discuss what you have found of value to build upon in your project, and in what ways your project is different or better. Supplement this description with a set of 3-4 screenshots that show the main design (visual and interaction) of the project.

2) Process: Technical

In this section, you are expected to explain the inner workings of your code in detail. In your own words, and with the help of screenshots, code snippets or possibly diagrams, break apart the logic behind your code, illustrating how different sections are functionally related. Describe the technical challenges that you faced, solutions you found as well as compromises you had to make.

What could have been implemented better and what changes you would make if you had the chance to do it all over again. What discoveries did you make along the way? Be as detailed and specific as you can.

3) Reflection and Future Development

Summarize your conclusions and critical reflections on your work. Consider how your project evolved from project proposal to its current version. In regards to the concept you set out to explore, which parts of the project work well and which ones are you less satisfied with.

Reflect on feedback received from peer students, instructor and guest critics and constructive adjustments to the project based on the feedback. Also demonstrate what you would like to implement further and how you would continue to explore in future work any of the ideas your project engaged.

4) Credits & References

Include in this section any technical help that your project received other than CCLab's course material (e.g. tutorials you might have watched or read) as well as references and projects that inspired your work conceptually and visually. Include links.
